Sustainability Through Innovation

KLEIBERIT 599

2C PUR for Metal Free Oil Filter Cartridges

KLEIBERIT has developed new, innovative moulding compounds based on polyurethane especially for the production of oil filters. The high resistance against motor oils, particularly at high temperatures up to 150 °C, enables an entirely new design for the production of oil filters. The metal end caps, which have up to now been glued on, are replaced with a moulded polyurethane end cap.

This innovative concept eliminates the need for a steel end cap. For the production of filters, this means that in addition to raw material cost savings there is also a considerable cost reduction due to fewer processing and handling steps as well as reduced parts storage. The weight savings also significantly reduce transportation and logistics costs. KLEIBERIT moulding compounds make a meaningful contribution to resource conservation and sustainability in the manufacturing of oil filters.
